

Video cards currently supported on the Mac:

- **The Formac Proformance 3 card works very well.**
- **ATI 128 Rage Orion, X-Claim VR 128, and Nexus 128 are great Mac cards! Get one!**
- **ATI Nexus GA** (<http://www.atitech.com>), using Rage-Pro chipset.
- **ATI XClaim VR, XClaim 3D** (<http://www.atitech.com>)... **GET THE MEMORY UPGRADE TO 8 MEG!**
- **All ATI cards with the Rage-2 chipset, DO work, BUT THESE CARDS ARE SLOW, AND NEED A MEMORY UPGRADE TO 6 MEG FROM ATI TO HAVE A CHANCE OF WORKING.** 6 meg does not cut it any more.
- MacTell Vision3D PRO II (<http://www.mactell.com>)... you should get the 8 meg card... this card is a little bit pricey.
- NewerTech RenderPix (<http://www.newertech.com/video/renderpix.html>), a very expensive but powerful video card.
- **MACINTOSH 3DFX CARDS ARE SUPPORTED** by a sort of patch. Click [here](#) to download the drivers.
The Voodoo-3 cards for Mac actually work quite well, we are told.

Any G3 will work with it's base card, (some were shipped with Rage-2's and some were shipped with Rage-Pro's) but if you have less than 6 meg of RAM on the chip then you will need to get a memory upgrade from ATI to at least 6 meg. This is not recommended for Rage-2 chips because they are slower chips... if you have a Rage-2 chip on your G3 then you should consider getting one of the cards at the top of this list.

G4's work great.
